POWER BI DASHBOARD

Visualization Analysis Report

Sales & Shipments Performance Dashboard

Prepared by: Asmitha Chapa

Date: April 2026

1. Executive Summary

This report provides a comprehensive analysis of the Power BI dashboard titled Sales & Shipments Performance Dashboard. The dashboard is organized across 6 report pages and contains 19 visualizations in total, covering product sales, geographic distribution, team performance, shipment trends, and profitability metrics.

The dashboard leverages four core data tables: shipments, products, locations (Geo), people, and calendar. Together these tables enable multi-dimensional analysis across product lines, sales regions, time periods, and sales personnel.

Dashboard at a Glance

Attribute	Detail
Total Report Pages	6 Pages
Total Visualizations	19 Visuals
Primary Data Tables	shipments, products, locations, people, calendar
Key Metrics Tracked	Total Amount, Total Profit, Profit %, Total Boxes, Shipment Count
Report Canvas Size	1280x720 (Pages 1-5), 1920x1080 (BI Report)
Theme	City Park (Custom Power BI Theme)

2. Page-by-Page Visualization Breakdown

2.1 Page 1 — Sales Amount by Product & Geography

Page 1 introduces two primary analytical visuals and one slicer for interactive filtering. The focus is on understanding how total sales amount is distributed across products and teams, with geographic filtering capability.

Visual 1 — Sales Amount by Product	
Chart Type	Column Chart (Vertical Bar Chart)
Data Fields	X-Axis: Product Name | Y-Axis: Sum of Amount
Description	This vertical bar chart displays the total sales amount for each product. Products are plotted on the horizontal axis and the corresponding sum of shipment amounts on the vertical axis. Bars are sorted in descending order, making it easy to identify the best-selling products at a glance.
Business Insight	*Quickly identifies top revenue-generating products. Decision-makers can spot underperforming products and take corrective actions such as promotions or discontinuation.*

Visual 2 — Geo Location Slicer	
Chart Type	Slicer (Filter Control)
Data Fields	Filter Field: Geo (Location)
Description	This interactive slicer allows users to filter all visuals on the page by geographic region. When a region is selected, all charts on the page dynamically update to reflect data for that specific location only.
Business Insight	*Enables regional analysis without building separate pages. Stakeholders can assess regional performance and compare sales across locations interactively.*

Visual 3 — Amount by Team	
Chart Type	Pie Chart
Data Fields	Values: Sum of Amount | Legend: Team (from People table)
Description	This pie chart breaks down total sales amount by sales team. Each slice represents a team's proportional contribution to total revenue. Hovering over slices reveals exact values and percentages.
Business Insight	*Highlights which sales teams are driving the most revenue. Useful for performance-based evaluations, team restructuring decisions, or incentive planning.*

2.2 Page 2 — Profit by Geography & Product Detail Table

Page 2 shifts focus to profitability metrics, presenting both a geographic profit comparison and a detailed product-level profit breakdown table.

Visual 1 — Total Profit by Geography	
Chart Type	Clustered Column Chart
Data Fields	X-Axis: Geo (Location) | Y-Axis: Total Profit
Description	This clustered column chart compares total profit across different geographic regions. Each bar represents a region's total profit, allowing direct comparison between locations. The chart highlights which regions are most and least profitable.
Business Insight	*Reveals geographic profitability disparities. Helps leadership prioritize high-margin regions for expansion and investigate low-margin regions for operational inefficiencies.*

Visual 2 — Product Profitability Table	
Chart Type	Table (Matrix View)
Data Fields	Columns: Product Name, Total Profit, Total Amount, Profit %
Description	A detailed tabular view listing each product alongside its total profit, total revenue, and profit margin percentage. This table supports precise numeric comparison across all products and allows sorting by any column.
Business Insight	*Serves as a financial summary at the product level. Analysts can identify which products have high revenue but low margins, signaling pricing or cost issues.*

2.3 Page 3 — Shipment Trends Over Time & by Team

Page 3 focuses on shipment activity, providing both a time-series view of shipment counts and a team-level breakdown of how many shipments each team handles.

Visual 1 — Shipment Count Over Time	
Chart Type	Line Chart (Time Series)
Data Fields	X-Axis: Year, Month Number (from Calendar table) | Y-Axis: Shipment Count
Description	This line chart plots the number of shipments over time, broken down by year and month. It reveals seasonal trends, peaks in shipment activity, and long-term growth or decline patterns in logistics operations.
Business Insight	*Critical for supply chain planning and inventory management. Identifying high-shipment months helps warehouse teams prepare capacity in advance, reducing delays.*

Visual 2 — Shipment Count by Team	
Chart Type	Donut Chart
Data Fields	Values: Shipment Count | Category: Team (People table)
Description	A donut chart showing the proportion of total shipments handled by each sales or logistics team. The central hole of the donut can display summary totals. Each arc segment represents a team's shipment share.
Business Insight	*Reveals workload distribution across teams. Identifies overburdened teams that may need additional resources, and underutilized teams that could absorb more volume.*

2.4 Page 5 — Salesperson Profit Performance

Page 5 is dedicated to individual salesperson performance, specifically around profitability. It contains four visuals — two ranked tables and one time-based profit chart — to identify top and bottom performers.

Visual 1 — Top 5 Profit % Employees	
Chart Type	Table
Data Fields	Columns: Sales Person, Total Profit, Profit %
Description	This table lists the top 5 salespersons ranked by profit percentage. It highlights employees who maximize profit margin rather than just raw revenue, rewarding efficiency over volume.
Business Insight	*Ideal for identifying high-efficiency salespeople as candidates for mentorship roles or bonuses. Profit % is a more meaningful KPI than raw sales volume for evaluating true performance.*

Visual 2 — Monthly Profit by Salesperson	
Chart Type	Clustered Column Chart
Data Fields	X-Axis: Year, Month Number | Y-Axis: Total Profit
Description	A bar chart showing how total profit evolves month by month across the calendar. Useful for identifying seasonal revenue patterns and months where profits dipped or spiked.
Business Insight	*Helps management understand whether profits are growing steadily or fluctuating. Month-over-month comparison supports forecasting and budget planning.*

Visual 3 — All Salesperson Profit Table	
Chart Type	Table
Data Fields	Columns: Sales Person, Total Profit, Profit %
Description	A comprehensive table listing all salespersons along with their total profit and profit percentage. Unlike the top/bottom 5 tables, this provides a complete unfiltered view of every salesperson's performance.
Business Insight	*Provides a holistic view for HR and management to review all-employee performance without filters, useful during appraisal cycles.*

Visual 4 — Bottom 5 Profit % Employees	
Chart Type	Table
Data Fields	Columns: Sales Person, Total Profit, Profit %

Description	This table surfaces the 5 salespersons with the lowest profit percentages. It draws attention to employees who may need coaching, better product training, or revised sales strategies.
Business Insight	*Enables targeted intervention before underperformance becomes a larger issue. Management can offer training programs or reassign territories to improve results.*

2.5 Page 8 — KPI Summary with Category Filter

Page 8 serves as a high-level KPI overview page with a product category slicer. It distills the entire dataset into five key metrics, allowing stakeholders to monitor performance at a glance.

Visual 1 — KPI Summary Card	
Chart Type	Card Visual (Multi-KPI)
Data Fields	Metrics: Total Amount, Total Boxes, Shipment Count, Total Profit, Profit %
Description	A card visual displaying five core KPIs side by side. Each metric is prominently shown in a large font for quick readability. This is the executive summary tile of the dashboard, showing the overall health of the business at a glance.
Business Insight	*Provides an immediate snapshot of business performance for executives and stakeholders who need quick answers without drilling into charts. Ideal for dashboard landing pages and weekly reviews.*

Visual 2 — Product Category Slicer	
Chart Type	Slicer (Dropdown / List Filter)
Data Fields	Filter Field: Category (Products table)
Description	A slicer that allows users to filter the KPI card by product category. When a category is selected, all five KPIs on the card update dynamically to reflect only that category's data.
Business Insight	*Makes the KPI card reusable across different product segments without duplicating pages. Management can compare how different product categories contribute to overall business metrics.*

2.6 BI Report Page — Comprehensive Business Intelligence Dashboard

The BI Report page is the flagship page of this dashboard, built at a higher resolution (1920x1080) for a premium presentation experience. It consolidates the most important visuals from across the report into a single, executive-level view.

Visual 1 — Amount by Geo (Donut Chart)	
Chart Type	Donut Chart
Data Fields	Values: Total Amount | Category: Geo (Location)
Description	A donut chart showing each geographic region's contribution to total sales amount. The donut format allows the centre to display a total figure while each arc shows regional share. This makes it easy to assess geographic revenue balance.
Business Insight	*Instantly communicates which regions are revenue leaders. Useful for geographic expansion planning and regional resource allocation.*

Visual 2 — Shipment Distribution	
Chart Type	Clustered Column Chart
Data Fields	X-Axis: Boxes (bins — grouped ranges) | Y-Axis: Shipment Count
Description	This chart visualizes the distribution of shipments across different box quantity ranges (bins). It shows how many shipments fall within each box range, revealing whether shipments are predominantly small, medium, or large in volume.
Business Insight	*Helps logistics teams understand shipment size patterns. If most shipments are in small box ranges, packaging and carrier selection can be optimized accordingly.*

Visual 3 — Top 6 Salespersons	
Chart Type	Table with Images
Data Fields	Columns: Picture, First Name, Total Amount, Total Boxes, Profit %
Description	A rich table featuring profile pictures of the top 6 salespersons alongside their name, total sales amount, total boxes shipped, and profit percentage. The inclusion of profile images adds a human element, making the leaderboard more engaging.
Business Insight	*Creates a motivating leaderboard culture. Recognizing top performers publicly drives healthy competition and boosts overall sales team morale.*

Visual 4 — Top 6 Products (Treemap)	
Chart Type	Treemap

Data Fields	Values: Total Amount | Group: Product Name | Tooltips: Total Boxes, Amount per Box
Description	A treemap where each rectangle represents a product, sized proportionally to its total sales amount. Larger tiles indicate higher-revenue products. Hovering reveals tooltip data including total boxes and amount per box. Color variations can indicate grouping by product category.
Business Insight	*Treemaps are highly effective for showing part-to-whole relationships. Decision-makers can spot dominant products instantly and assess portfolio balance.*

Visual 5 — Our Products Table	
Chart Type	Table
Data Fields	Columns: Product Name, Total Amount, Profit %
Description	A clean summary table listing all products with their total sales amount and profit margin percentage. This table complements the treemap by providing exact numeric values, allowing precise comparison of products that may appear similar in size on the treemap.
Business Insight	*Bridges the gap between visual storytelling (treemap) and precise data (table). Analysts can validate visual impressions with actual figures.*

Visual 6 — Overall KPI Card	
Chart Type	Card Visual (Multi-KPI)
Data Fields	Metrics: Total Amount, Total Boxes, Shipment Count, Total Profit, Profit %
Description	The same KPI card used on Page 8 is embedded here on the BI Report page to ensure that top-line business metrics are always visible regardless of which chart the viewer is focused on. It acts as a persistent performance anchor.
Business Insight	*Prevents context loss when analyzing individual charts. Executives reviewing the BI Report page always have the global numbers in view for reference.*

3. Data Model Overview

The dashboard is powered by a relational data model comprising five tables. Each table serves a specific analytical dimension, and they are joined through key relationships to enable cross-dimensional analysis.

Table	Key Fields	Role in Dashboard
shipments	Amount, Total Profit, Profit %, Total Boxes, Shipment Count, Boxes (bins)	Core fact table — all financial and logistic metrics originate here
products	Product, Category	Product dimension — enables product-level and category-level filtering
locations	Geo	Geographic dimension — enables regional analysis and slicing
people	Sales_person, Team, First Name, Picture	HR dimension — enables team and individual salesperson analysis
calendar	year, Month_num	Time dimension — enables trend analysis over months and years

4. Visualization Type Summary

The following table summarizes all visualization types used across the dashboard and the number of instances of each type.

Visualization Type	Count	Pages Used On
Table (tableEx)	6	Page 2, Page 5, BI Report
Clustered Column Chart	3	Page 2, Page 5, BI Report
Donut Chart	2	Page 3, BI Report
Card Visual (Multi-KPI)	2	Page 8, BI Report
Slicer (Filter)	2	Page 1, Page 8
Column Chart (Standard)	1	Page 1
Pie Chart	1	Page 1
Line Chart	1	Page 3
Treemap	1	BI Report
Total	19	6 Pages

5. Key Business Insights Enabled by This Dashboard

The following insights can be directly derived from this Power BI dashboard:

Revenue & Product Performance

- The Column Chart on Page 1 enables rapid identification of best-selling and underperforming products by total amount.
- The Treemap on the BI Report page provides an intuitive portfolio view showing which products dominate revenue.
- The Product Profitability Table on Page 2 highlights products where high revenue does not translate to high profit margin.

Geographic Analysis

- The Geo Slicer on Page 1 allows any visual to be filtered to a specific region, enabling targeted regional reviews.
- The Clustered Column Chart on Page 2 surfaces profit disparities between geographic regions.
- The Donut Chart on the BI Report shows each region's revenue share, supporting market prioritization decisions.

Team & Salesperson Performance

- The Pie Chart on Page 1 shows each team's revenue contribution, supporting team-level incentive planning.
- The Top and Bottom 5 Profit % tables on Page 5 enable targeted coaching interventions.
- The Top 6 Salespersons leaderboard with profile photos on the BI Report creates a culture of recognition.

Shipment & Logistics Trends

- The Line Chart on Page 3 reveals seasonal shipment patterns, supporting supply chain planning.
- The Donut Chart on Page 3 shows team-level shipment workload distribution.
- The Shipment Distribution histogram on the BI Report reveals typical order sizes, informing logistics optimization.

Executive Monitoring

- The KPI Card Visuals on Pages 8 and the BI Report provide instant visibility into the five most critical business metrics.
- The Product Category Slicer on Page 8 allows rapid segmentation of KPIs by product line without navigating to a different page.

6. Recommendations for Dashboard Enhancement

Based on the current structure of the dashboard, the following enhancements are recommended to increase analytical depth and usability:

Add Date Range Slicers

Currently, time filtering relies on axis-level drilling in the line chart. Adding a date range slicer to Pages 3 and 5 would allow users to filter all visuals to a specific time window simultaneously.

Include a Tooltip Page

Power BI supports custom tooltip pages. Creating one with enriched context (e.g., product images, historical trends) would make hover interactions more informative.

Add Conditional Formatting to Tables

Applying color-coded conditional formatting to the Profit % column in all tables would make high and low margins immediately visible without reading individual values.

Drillthrough Pages

Adding drillthrough pages for individual salespersons and products would allow users to right-click any data point and navigate to a dedicated detail page for that entity.

Mobile Layout Optimization

Configuring mobile-optimized layouts for the BI Report page (currently 1920x1080) would ensure the dashboard is usable on mobile devices without horizontal scrolling.

Row-Level Security (RLS)

Implementing RLS would allow regional managers to see only their geographic data, improving data governance and making the dashboard suitable for broader distribution.

End of Report
